

Removing overcount: Shepherd's Principle applied

NUMERATOR:
Chaotic Count of ALL Leg Pairs

DENOMINATOR:
Legs per fixed sheep

RESULT:
Count distinct organized sheep

NUMERATOR:
Chaotic Count of ALL Ordered Bases

DENOMINATOR:
Bases per fixed subspace

RESULT:
Count of distinct subspaces

Summary: Partitioning Total Bases into Distinct Subspaces

$$\frac{\text{Total ordered bases (All Legs)}}{\text{Bases per Subspace (Legs per Sheep)}} = \text{Total Distinct Subspaces (Sheep)} \longleftrightarrow \left[\begin{matrix} n \\ k \end{matrix} \right]_q$$
